Problem Statement: Abalone Age Prediction

Description:

Predicting the age of abalone from physical measurements. The age of abalone is determined by cutting the shell through the cone, staining it, and counting the number of rings through a microscope -- a boring and time-consuming task. Other measurements, which are easier to obtain, are used to predict age. Further information, such as weather patterns and location (hence food availability) may be required to solve the problem.

Importing Modules

```
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
import numpy as np
```

1. Dataset has been downloaded

```
In []: #Name of the dataset: abalone.csv
```

2. Load the dataset into the tool

```
In [ ]: data=pd_read_csv("abalone.csv")
    data_head()
```

Let's know the shape of the data

```
In [ ]: data_shape
Out[ ]: (4177, 9)
```

One additional task is that, we have to add the "Age" column using "Rings" data. We just have to add '1.5' to the ring data

```
In []: Age=1.5+data_Rings
   data["Age"]=Age
   data=data_rename(columns = {'Whole weight':'Whole_weight','Shucked weight': 'Shell_weight': 'Shell_weight'})
   data=data_drop(columns=["Rings"],axis=1)
   data_head()
```

3. Perform Below Visualizations.

(i) Univariate Analysis

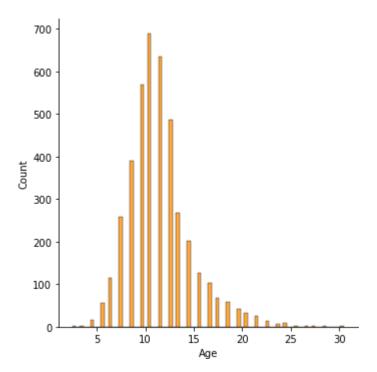

The term univariate analysis refers to the analysis of one variable. You can remember this because the prefix "uni" means "one." There are three common ways to perform univariate analysis on one variable: 1. Summary statistics – Measures the center and spread of values.

Histogram

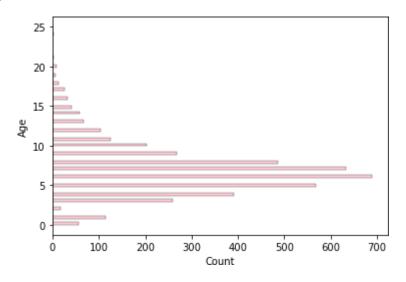

```
In []: sns_displot(data["Age"], color='darkorange')

Out[]: 
cseaborn.axisgrid.FacetGrid at 0x7fd3f837a430>
```

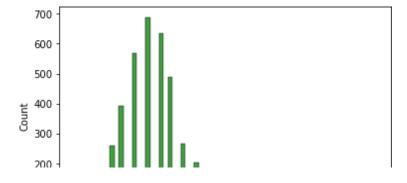

In []: sns_histplot(y=data_Age,color='pink')

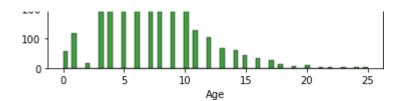

Out[]: <AxesSubplot:xlabel='Count', ylabel='Age'>

In []:
sns_histplot(x=data_Age,color='green')

Out[]: <AxesSubplot:xlabel='Age', ylabel='Count'>

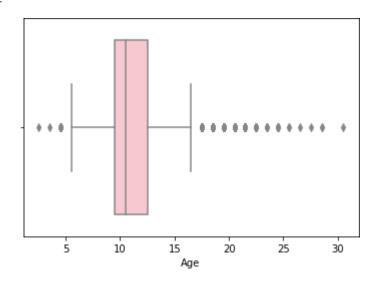

Boxplot

In []: sns_boxplot(x=data_Age,color='pink')

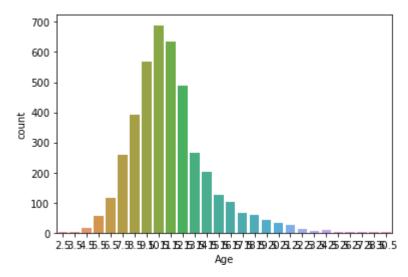

Out[]: <AxesSubplot:xlabel='Age'>

Countplot

In []: sns_countplot(x=data_Age)

Out[]: <AxesSubplot:xlabel='Age', ylabel='count'>

(ii) Bi-Variate Analysis

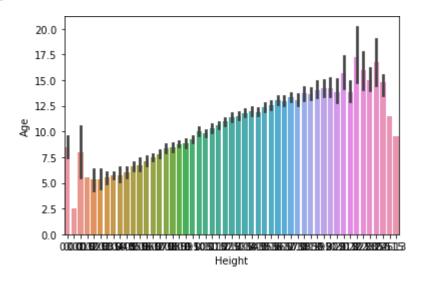

Image result for bivariate analysis in python It is a methodical statistical technique applied to a pair of variables (features/ attributes) of data to determine the empirical relationship between them. In order words, it is meant to determine any concurrent relations (usually over and above a simple correlation analysis).

Barplot

In []:
 sns_barplot(x=data_Height,y=data_Age)

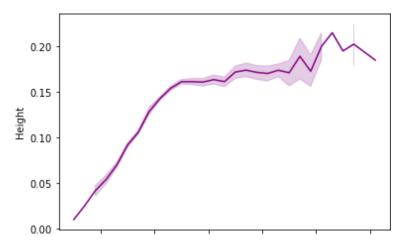

Out[]: <AxesSubplot:xlabel='Height', ylabel='Age'>

Linearplot

In []: sns_lineplot(x=data_Age,y=data_Height, color='purple')

Out[]: <AxesSubplot:xlabel='Age', ylabel='Height'>

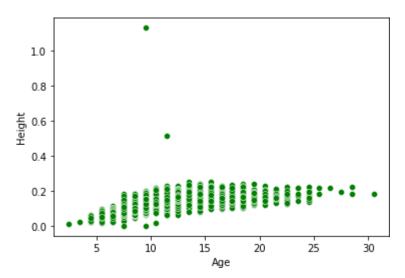

```

```

Scatterplot

```
In [ ]: sns_scatterplot(x=data_Age,y=data_Height,color='green')
```

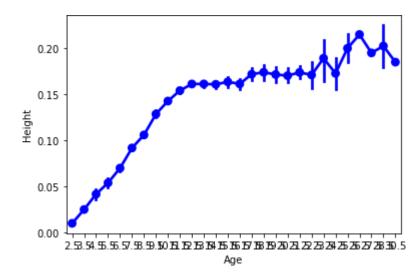

Out[]: <AxesSubplot:xlabel='Age', ylabel='Height'>

Pointplot

```
In [ ]: sns_pointplot(x=data_Age, y=data_Height, color="blue")
```

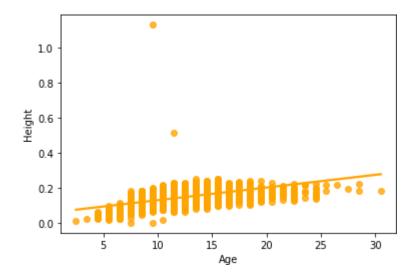

Out[]: <AxesSubplot:xlabel='Age', ylabel='Height'>

Regplot

```
In [ ]: sns_regplot(x=data_Age,y=data_Height,color='orange')
```

Out[]: <AxesSubplot:xlabel='Age', ylabel='Height'>

(iii) Multi-Variate Analysis

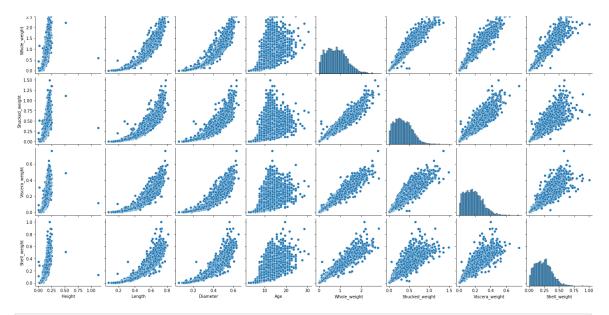

Multivariate analysis is based in observation and analysis of more than one statistical outcome variable at a time. In design and analysis, the technique is used to perform trade studies across multiple dimensions while taking into account the effects of all variables on the responses of interest.

Pairplot

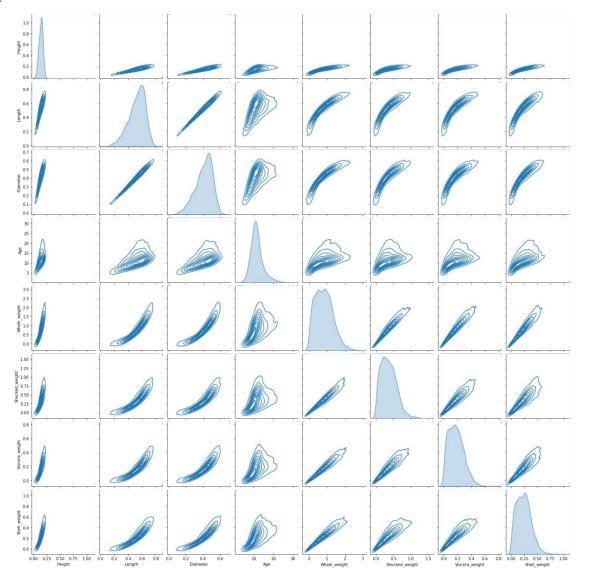

```
In []: sns-pairplot(data=data[["Height", "Length", "Diameter", "Age", "Whole_weight", "Shuc

Out[]: seaborn.axisgrid.PairGrid at 0x7fd3d93e1040>
```

In []: sns_pairplot(data=data[["Height","Length","Diameter","Age","Whole_weight","Shuc

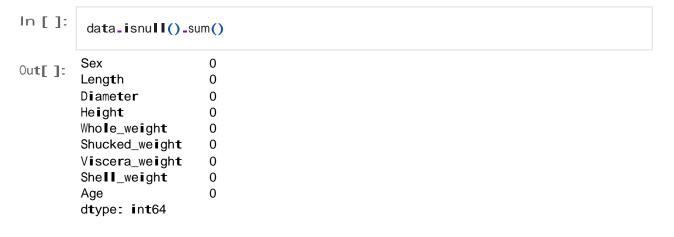

Out[]: <seaborn.axisgrid.PairGrid at 0x7fd39840c790>

4. Perform descriptive statistics on the dataset
